# Graph Analysis Trends and Opportunities

Dr. Jason Riedy and Dr. David Bader

Georgia Institute of Technology

# Dr. Jason Riedy

- ▶ Research Scientist II, Computational Science and Engineering
- ▶ PhD UC Berkeley, 2010
- ▶ Major developer of STING, community-el, and other used graph analysis codes
- ▶ PI or co-PI on > 5 current funded graph analysis projects
- ▶ Primary author of the Graph500 specification
- ▶ Program Committees for HPC conferences including IPDPS, HiPC, ICPP
- ▶ 20+ refereed publications, dozens of cited technical reports,  $\geq 350$  citations, etc.
- ▶ Widely used code in packages like LAPACK, BLAS; contributions ranging from git to GNU R and Octave

# Outline

Graph Analysis Introduction

Motivation and Applications

Data Volumes and Velocities

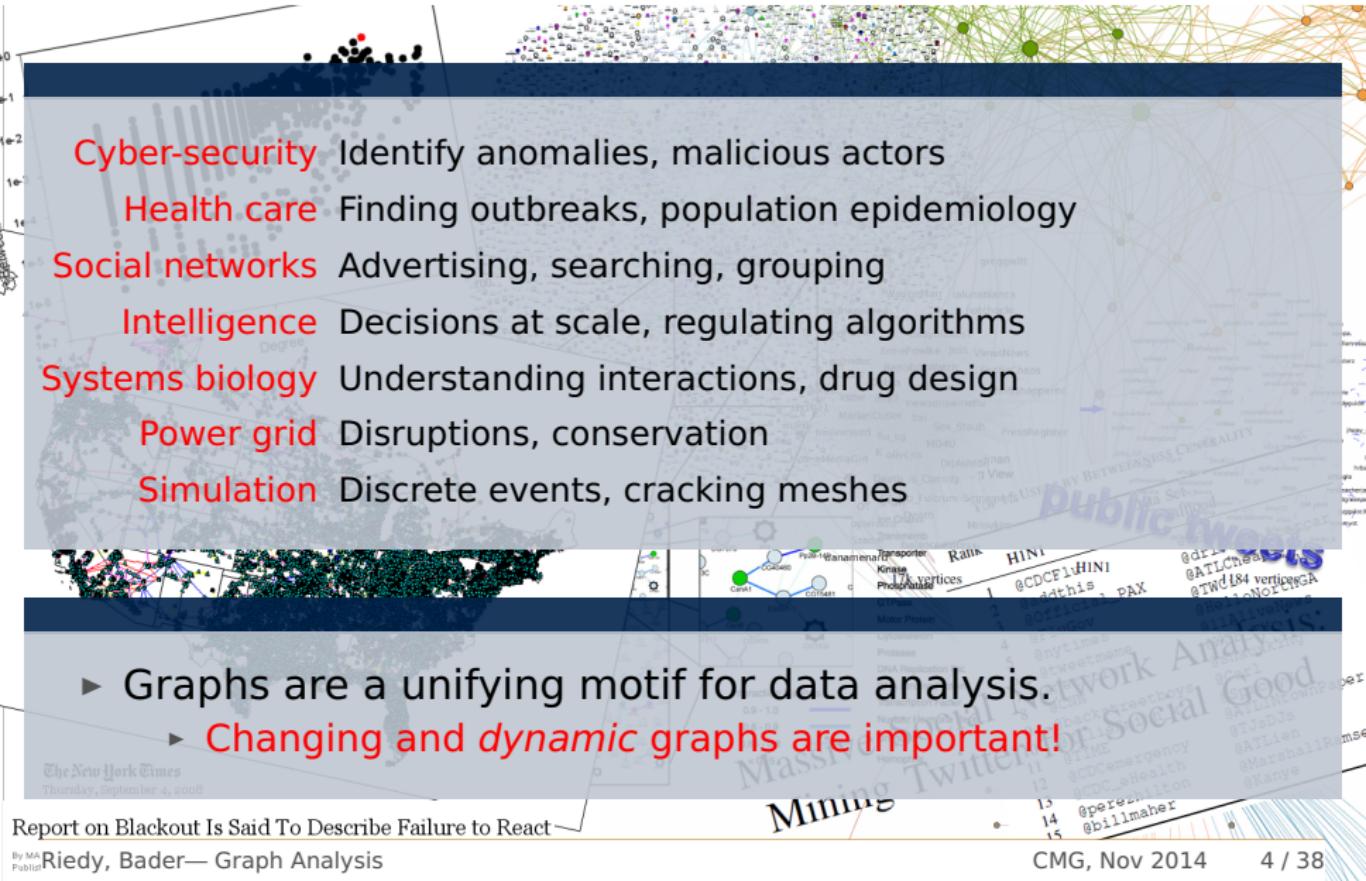

Methods

Tools

Hardware

Summary and Opportunities

# (insert prefix here)-scale data analysis

- 
- Cyber-security** Identify anomalies, malicious actors
  - Health care** Finding outbreaks, population epidemiology
  - Social networks** Advertising, searching, grouping
  - Intelligence** Decisions at scale, regulating algorithms
  - Systems biology** Understanding interactions, drug design
  - Power grid** Disruptions, conservation
  - Simulation** Discrete events, cracking meshes

- ▶ Graphs are a unifying motif for data analysis.
  - ▶ Changing and *dynamic* graphs are important!

Report on Blackout Is Said To Describe Failure to React

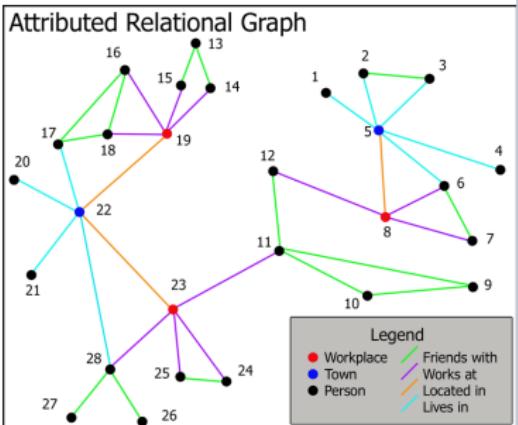

By M.Riedy, Bader— Graph Analysis

Mining

CMG, Nov 2014

4 / 38

# Why Graphs?

- Smaller, more generalized than raw data.
- Taught (roughly) to all CS students...
- Semantic attributions can capture essential *relationships*.
- Traversals can be faster than filtering DB joins.
- Provide clear phrasing for queries about *relationships*.

**Often next step after dense and sparse linear algebra.**

# Graphs: A Fundamental Abstraction

## Structure for “unstructured” data

- ▶ Traditional uses:
  - ▶ Route planning on fixed routes
  - ▶ Logistic planning between sources, routes, destinations
- ▶ Increasing uses:
  - ▶ Computer security: Identify anomalies (e.g. spam, viruses, hacks) as they occur, insider threats, control access, localize malware
  - ▶ Data / intelligence integration: Find smaller, relevant subsets of massive, “unstructured” data piles
  - ▶ Recommender systems (industry): Given activities, automatically find other interesting data.

# Application: Analyzing Twitter for Social Good

## Massive Social Network Analysis: Mining Twitter for Social Good

## ICPP 2010

**Abstract**—Social networks produce an enormous quantity of data. Facebook consists of over 400 million active users sharing over 5 billion pieces of information each day. Analyzing the connectivity of such large-scale datasets presents challenges for software and hardware. We present GraphCT, a Graph Characterization Toolkit for massive graphs represented as social network data. On a 128-processors Cray XT4 system, we report the computation of betweenness centrality of an artificially generated (R-MAT) 537 million vertex, 8.6 billion edge graph in 55 minutes and a real-world graph (Kwak, et al.) with 61.8 million vertices and 1.47 billion edges in 105 minutes. We use GraphCT to analyze public data from Twitter, a microblogging network. Twitter's message connection appears to be a tree-structured as a news dissemination system. Within the greggwitt

involves over 400 million active users with an avg 120 friendship connections each and sharing 5 references to items each month [11].

One analysis approach treats the interactions as and applies tools from graph theory, social network analysis, and scale-free networks [29]. However, volume of data that must be processed to apply techniques overwhelms current computational caps. Even well-understood analytic methodologies advances in both hardware and software to process growing corpus of social media.

Social media provides staggering amounts of

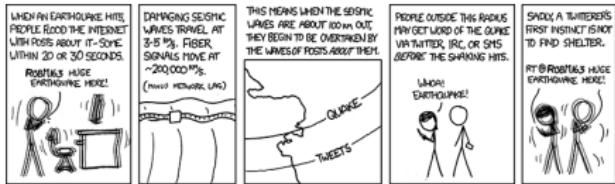

Fig. 3. Subcommunity filtering on Twitter data sets

# Application: Social Network Analysis

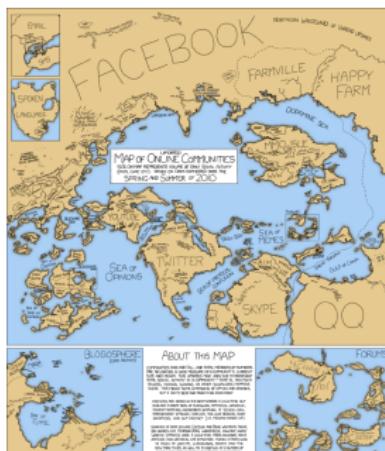

## Problems

- ▶ Detecting “communities” automatically
- ▶ Identifying important individuals
- ▶ Given a few members, finding a joint community
- ▶ Finding *actual* anomalies

What techniques can scale to massive, noisy, *changing* populations?

<http://xkcd.com/723>

<http://xkcd.com/802>

## And more applications...

- ▶ Cybersecurity
  - ▶ Determine if new packets are allowed or represent new threat in < 5ms...
  - ▶ Is the transfer a virus? Illicit?
- ▶ Credit fraud forensics ⇒ detection ⇒ monitoring
  - ▶ Integrate all the customer's data
  - ▶ Becoming closer to real-time, massive scale
- ▶ Bioinformatics
  - ▶ Construct gene sequences, analyze protein interactions, map brain interactions
  - ▶ Amount of *new* data arriving is growing massively
- ▶ Power network planning, monitoring, and re-routing
  - ▶ Already nation-scale problem
  - ▶ As more power sources come online (rooftop solar)...

# No shortage of data...

## Existing (some out-of-date) data volumes

NYSE 1.5 TB generated daily into a maintained 8 PB archive

Google "Several dozen" 1PB data sets (CACM, Jan 2010)

LHC 15 PB per year (avg. 21 TB daily)

Wal-Mart 536 TB, 1B entries daily (2006)

EBay 2 PB traditional DB, and 6.5PB streaming, 17 trillion records,  
1.5B records/day, web click = 50–150 details. (2009)

Facebook > 1B monthly users...

- ▶ All data is *rich* and *semantic* (**graphs!**) and **changing**.
- ▶ Base data rates include items and not *relationships*.

# Data velocities

## Data volumes

NYSE >1.5TB daily

LHC >41TB daily

NG seq. 150GB per machine daily

Facebook Who knows?

## Data transfer

- ▶ 1 Gb Ethernet: 8.7TB daily at 100%, 5-6TB daily realistic
- ▶ PB disk rack, parallel 10GE: 1.7PB daily streaming read/write
- ▶ CPU ↔ Memory: QPI, HT: 5+PB/day@100%

## Data growth

- ▶ Facebook: > 2x/yr
- ▶ Twitter: > 10x/yr
- ▶ Growing sources: Health, sensors, security

## Speed growth

- ▶ Ethernet/IB/etc.: 4x in next 2 years?
- ▶ Memory: Slow growth, possible bump?
- ▶ Direct storage: flash, then what?

# Streaming graph data

## Data Rates

### Networks:

- ▶ Gigabit ethernet: 81k – 1.5M packets per second
- ▶ Over 130 000 flows per second on 10 GigE

### Person-level, from [www.statisticsbrain.com](http://www.statisticsbrain.com):

- ▶ 58M posts per day on Twitter (671 / sec)
- ▶ 1M links shared per 20 minutes on Facebook

## Opportunities

- ▶ Often analyze only changes, not *entire* graph
- ▶ Throughput & latency: Different levels of concurrency

# Methods

Graph Analysis Introduction

Methods

Example Algorithm: BFS, Graph500

Methods for Streaming Data

Algorithmic Disruptions

Tools

Hardware

Summary and Opportunities

# General approaches: Static and Streaming

## Different approaches

- ▶ High-performance *static graph analysis*
  - ▶ Techniques apply to unchanging massive graphs
  - ▶ Provides useful after-the-fact information, starting points.
  - ▶ Serves many existing applications well: market research, much bio- & health-informatics...
  - ▶ Massive-scale algorithms need to be  $O(|E|)$  or approximated down to it.
- ▶ High-performance **streaming graph analysis**
  - ▶ Focus: smaller dynamic changes within massive graphs
    - ▶ Streaming data, not CS-style streaming algorithms
  - ▶ Find trends or new information as they appear.
  - ▶ Serves upcoming applications: fault or threat detection, trend analysis, online prediction...
  - ▶ Can be  $O(|\Delta E|)$ ?  $O(\text{Vol}(\Delta V))$ ?
    - ▶ Less data  $\Rightarrow$  faster, more efficient, **lower latency**

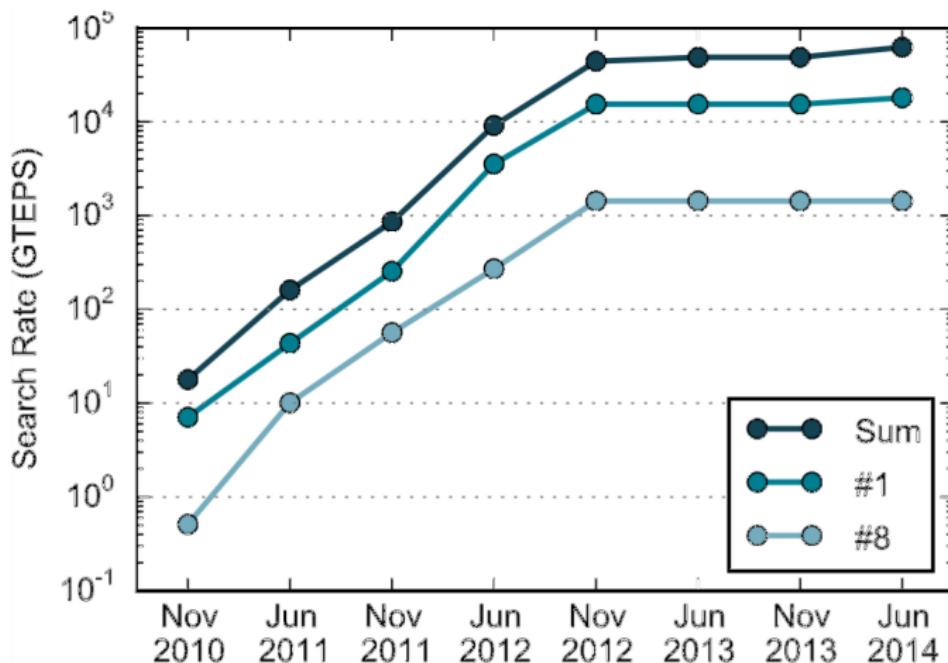

# Breadth-First Search

## The problem...

Build a tree from a starting vertex by repeatedly visiting all immediate, unvisited neighbors. At each traversal, record **a** parent. Repeat until there are no unvisited neighbors.

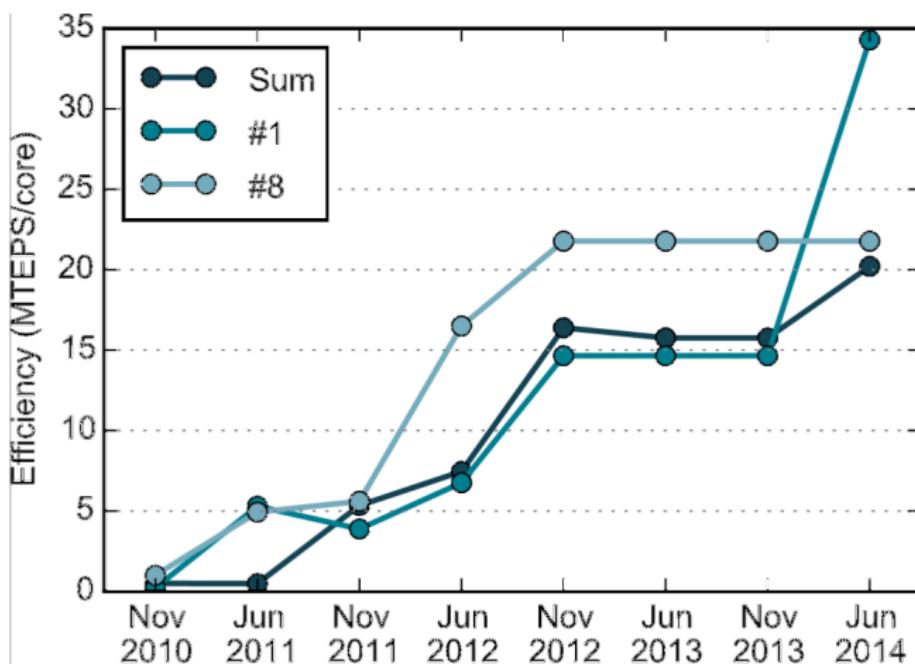

- ▶  $O(|V| + |E|)$ , but problem-dependent parallel performance
- ▶ Core of *many* scalable, parallel graph algorithms
- ▶ *Non-deterministic* when any parent works
- ▶ Base of the Graph500 benchmark, “fastest traversal”
- ▶ Isn’t it done yet? **Nope.**

# Graph500 Perf/Cores History

Plot courtesy of Scott Beamer, UC Berkeley

## Graph500 Perf v. Size, Summer 2014

# Streaming Queries

## Different kinds of questions

- ▶ How are individual graph metrics (e.g. clustering coefficients) changing?
- ▶ What are the patterns in the changes?
  - ▶ Are there seasonal variations?
  - ▶ What are responses to events?
- ▶ What are *temporal anomalies* in the graph?
  - ▶ Do key members in clusters / communities change?
  - ▶ Are there indicators of event responses before they are obvious?

New kinds of queries, new challenges...

# Performance on Streaming Graphs

## Work at Georgia Tech

- ▶ Triangle counting / clustering coefficients
  - ▶ Up to 130k graph updates per second on X5570 (Nehalem-EP, 2.93GHz)
- ▶ Connected components & spanning forest
  - ▶ Over 88k graph updates per second on X5570
- ▶ Community detection & maintenance
  - ▶ Up to 100 million updates per second, 4-socket 40-core Westmere-EX
  - ▶ (*Note: Most updates do not change communities...*)
- ▶ Incremental PageRank
  - ▶ Reduce lower latency by  $> 2\times$  over restarting
- ▶ Betweenness centrality
  - ▶  $O(|V| \cdot (|V| + |E|))$ , can be sampled
  - ▶ Speed-ups of  $40\times$ – $150\times$  over static recomputation

# Algorithmic Disruptions

- ▶ **Current:** Computing on the data *as it arrives*, not recomputing over all data.
  - ▶ Faster, lower latency, lower power...
- ▶ New algorithms for old problems.
  - ▶ Many practical parallel graph algorithms are not “work-efficient.”
  - ▶ New work is finding work-efficient *and* practical methods: Connected components (CMU: Shun, Dhulipala, Blelloch, SPAA 2014), betweenness centrality (McLaughlin and Bader, SC14)
- ▶ Approximations and coping with errors
  - ▶ There is very little approximation theory for graph algorithms.
  - ▶ Not sure which metrics are sensitive to sampling, errors... (Zakrzewska and Bader, PPAM 2013)

# Tools

## Graph Analysis Introduction

## Methods

## Tools

- Graph Databases
- Cluster/Cloud Tools
- “Capability” Tools
- HPC Tools
- Streaming Tools
- Software Disruptions

## Hardware

# Tools

## Rough Categories

Graph DB Neo4j, Sparksee (was DEX), AllegroGraph, Sesame, Titan, Flock...

Clusters/Cloud GraphX, Pregel, giraph, pegasus...

“Capability” igraph, networkX

HPC KDT / GraphBLAS, GraphLab, NetworkKIT, GraphCT

Streaming GT STINGER

# Graph Databases

## Pros

- ▶ Incredibly flexible data models
- ▶ Large ecosystem:
  - ▶ query and viz tools
  - ▶ data management tools

## Cons

- ▶ Standard query languages do not support most algorithms.
- ▶ The flexibility costs performance. Analysis algorithms run  $10\times - 100\times$  slower than more specific analysis tools, at least. ("A Performance Evaluation of Open Source Graph Databases," R. McColl, et al., 2014)

# Cluster/Cloud Tools

## Pros

- ▶ Growing ecosystem, large buzz
- ▶ Simple to write simple analyses.
- ▶ Often the only systems that handle hardware failure!

## Cons

- ▶ Performance can be comparable to graph databases...
- ▶ Often incredibly difficult to write more complex algorithms
- ▶ Clusters are expensive compared to single-node.
  - ▶ Many more power supplies
  - ▶ Wasted memory on OSes

# “Capability” Tools

## Pros

- ▶ Stockpiles of algorithms
- ▶ Available for many interactive environments (e.g. R)
- ▶ Good solution for exploring analysis of small data sets

## Cons

- ▶ Rarely ever parallel
- ▶ Often cannot scale to large problems

# HPC Tools

## Pros

- ▶ HPC: Fast. Really fast. Often fastest.
- ▶ Scale to large problems
- ▶ Exist for traditional HPC boxes, “cloud” allocations, etc.
  - ▶ Also for large-memory servers!

## Cons

- ▶ Distributed-memory versions use very focused models for performance
  - ▶ GraphBLAS: Sparse matrix - sparse vector product
  - ▶ GraphLab: Vertex programs
- ▶ If your problem does not fit the model...
- ▶ Algorithms still being developed

# Streaming Tools

## Pros

- ▶ Great fit for streaming problems!
- ▶ Astounding speed-ups over static re-analysis. Speed-up grows with problem size.
- ▶ Can target high throughput or low latency.

## Cons

- ▶ There really aren't many tools... (STINGER at GT)
- ▶ Terminology is very much in flux...
- ▶ Algorithms are still being designed...

# Software Disruptions

- ▶ New algorithms are being developed, tuning can be astronomically hard.
  - ▶ “Work-efficient” is not always fastest, need sampling and run-time algorithm selection (McLaughlin and Bader, SC 2014)
- ▶ **Combinations:** Let each tool do what it does well.
  - ▶ Cloud/cluster: Fantastic for data extraction
  - ▶ HPC tools: Fantastic for analysis
  - ▶ Combination: Kang and Bader, MTAAP 2010, reduce analysis time by **five orders of magnitude**.
  - ▶ Cloud extraction → streaming processing: Demonstrated with STINGER at Research@Intel 2013, GraphLab Workshop 2013

# Hardware

Graph Analysis Introduction

Methods

Tools

Hardware

Architecture Requirements

Existing Platforms

Disruptive Platform Changes

Summary and Opportunities

# Architecture Requirements for Efficiency

## The issues

- ▶ Runtime is dominated by latency
  - ▶ “Random” accesses to global graph and data storage
  - ▶ Can hot-spot: Many accesses to the same place
- ▶ Essentially no computation to hide the latency
- ▶ Access pattern is problem dependent
  - ▶ Prefetching can hinder performance
  - ▶ Often only want a small portion of data
- ▶ Most parts suffer from abysmal locality in memory
- ▶ Cannot require a nuclear reactor.

# Architecture Requirements for Efficiency

## Some desires

- ▶ Large memory capacity
- ▶ Low latency, high bandwidth, high injection rate
  - ▶ For very small messages!
- ▶ Latency tolerance (threading...)
- ▶ Light-weight, localized synchronization
- ▶ Global address space
  - ▶ Partitioning is nigh impossible
  - ▶ Ghost nodes everywhere
  - ▶ Algorithms are difficult enough to implement

# Existing Platforms

- ▶ Distributed memory / cluster
  - ▶ Cloud-ish: Slow network, massive storage
  - ▶ HPC-ish: Fast network, less storage
- ▶ Shared memory
  - ▶ Single motherboard: Ultra-fast network, little storage
  - ▶ Many motherboards: Tricky...
- ▶ Accelerators: Tiny memory, incredible bandwidth

Now start combining the platforms...

# Mapping Problems to Platforms

- ▶ Distributed memory / cluster
  - ▶ Cloud-ish: Fantastic for massive storage, extraction
  - ▶ HPC-ish: Great for known, forensic analysis on extracted graph
  - ▶ All of them eat power.
- ▶ Shared memory
  - ▶ Highly-threaded, single node: Focused analysis, streaming
  - ▶ Highly-threaded, multi-node: Often hard to extract *enough* parallelism (Cray XMT / URiKA)
  - ▶ Multi-node virtual shared memory: Re-eval in progress
  - ▶ Single node often eats less power, but...
- ▶ Accelerators
  - ▶ Very, very focused analysis
  - ▶ Can be very energy-efficient (McLaughlin, Riedy, Bader, HPEC 2014)

# Disruptive Platform Changes

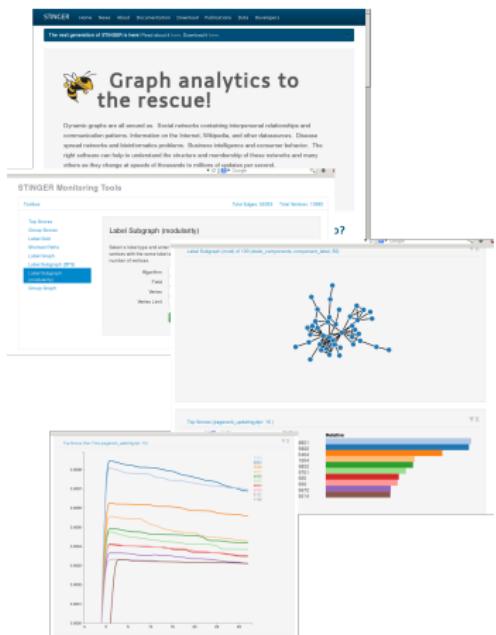

- ▶ In next 3–5 years, memory is going to change.
  - ▶ 3D stacked memory (IBM, NVIDIA)
  - ▶ Hybrid memory cube (HMC Cons., Micron, Intel)
  - ▶ Programming logic layer on-chip
  - ▶ Possibly non-volatile
  - ▶ Order of magnitude higher bandwidth
  - ▶ Order of magnitude lower energy cost
- ▶ This is happening. You can obtain HMC-FPGA combinations for testing.
- ▶ Interconnects are changing.
  - ▶ Processor  $\Leftrightarrow$  memory  $\Leftrightarrow$  accelerator (NVLink, Phi)
  - ▶ Data-center networks finally may change, not just  $n$ GbE

# Summary and Opportunities

*We live in interesting times.*

- ▶ Graph analysis tools, platforms are developing rapidly.
  - ▶ Only just starting to combine platforms and map problems appropriately.
- ▶ Performance is developing rapidly.
  - ▶ New algorithms, improved implementations, better platform choices
  - ▶ New **approaches** like streaming and approximation
- ▶ Even bigger changes are coming.
  - ▶ Can you imagine a PB of non-volatile storage at nearly RAM speed and latency?

# STINGER: Where do you get it?

**[www.cc.gatech.edu/stinger/](http://www.cc.gatech.edu/stinger/)**

Gateway to

- ▶ code,
- ▶ development,
- ▶ documentation,
- ▶ presentations...

Remember: Still academic code, but maturing.
